# Power Management

## Overview

As one of the world's leading suppliers of both integrated and discrete power conversion semiconductors, ST's Power Management ICs enable energy-saving, high-power-density and lower-standby-power design solutions.

Our product portfolio includes highly-integrated **Gallium Nitride (GaN) Power ICs**, **AC-DC converters**, **switching DC-DC converters**, **linear voltage regulators**, **battery management ICs**, **LED drivers**, **photovoltaic ICs**, **MOSFET and IGBT drivers**, **motor drivers** and more.

These integrated solutions reduce the design cycle and ST's **eDesignSuite** allows you to rapidly select and simulate the optimal configuration for your power management design, bringing a further advantage in time-to-market.

## Our Power Management IC Portfolio

### AC-DC Converters

Offline converters, PFCs and a variety of controllers and supervisors/housekeeping ICs.

### Battery Management ICs

Battery management for wearable and IoT wireless chargers.

### DC-DC Switching Converters

High efficiency switching regulators, wide Vin range and lout capability for consumer, industrial and automotive.

### Display Supplies and Controllers

Display PSU portfolio enabling solutions of high quality images, energy saving, high-power-density.

### Energy Harvesting and Solar Charging ICs

Supply the Internet of Things ecosystem by extracting energy from ambient light or thermal differences.

### Gallium Nitride (GaN) Power ICs

High-voltage GaN Converters, STDRIVE® GaN drivers and Integrated Smart GaNs MASTERGAN, advanced power System-in-Package.

### Gate Drivers

Include integrated high-voltage half-bridge, single and multiple low-voltage gate drivers.

### High-density Power Drivers

System in Package (SiP) solutions integrating in compact QFN packages the STDRIVE gate drivers and MOSFET-based power stages.

### eFuses and hot-swap ICs

Advanced protection ICs, including current limiters, electronic fuses and DC power breakers.

### Intelligent Power Switches

Ideal for high-side and low-side configurations, they integrate the control section and power stage on the same chip.

### LED Drivers

Multi-topologies with high-driving performances and efficiency, for automotive and industrial applications.

### Lighting ICs

High-voltage ballast controllers for analog solutions and complete power management units for digital platforms.

### Linear Voltage Regulators

Rugged industry-standard linear regulators and high performance LDOs in tiny package.

### LNB Supplies

for analog and digital satellite receivers and Sat-PC cards with extremely low component count.

### Photovoltaic ICs

Cool bypass switches for improved reliability and DC-DC converters with built-in MPPT for increased power conversion.

### Power Management and SBCs

Power Mgt and System Basis ICs conceived to fit into automotive infotainment and telematics systems, electronic control units (ECU) and car body modules

### Power Over Ethernet ICs

Compliant with both the more recent IEEE 802.3at specification (POE+) and the former IEEE 802.3af (PoE).

### Voltage References

Fixed and adjustable high-power shunt, high precision/low power shunt and series voltage references.

### Wireless Charger ICs

A complete portfolio of both transmitter and receiver chip-sets optimized for different implementation requirements.

## AC-DC Converters

### Overview

With robust, advanced high-voltage converters, power factor correctors, a variety of controllers and supervisors/housekeeping ICs, together with innovative architectures and extended temperature ranges.

ST can offer integrated solutions and meet all switching-mode power supply design needs.

New generation **AC-DC converters** reduce power consumption and increase efficiency, essential for powering the majority of mains equipment. When combined together, ST power factor correctors, PWM controllers and offline converters significantly lower system power consumption to outperform the most demanding energy-saving regulations, such as 80 PLUS® Initiative, ErP Lot 6, Energy Star, and many others.

**Power Management / AC-DC Converters /Digital and Resonant Controllers**

# Battery Management ICs

## Overview

Battery management ICs play an important role in ensuring the safety of users, while making sure they get the most out of their battery-powered devices. Battery management solutions require accurate voltage, current, and temperature measurements to determine the exact state of charge of batteries and battery packs.

Battery management ICs also ensure safety by monitoring cell temperatures during use and charging and cutting energy if temperature limits are reached.

## Applications

ST Battery management ICs find applications in many sectors and use cases, including digital cameras, small appliances, and even small electric vehicles.

Personal electronics

Industrial

Automotive

## Product types

The ST portfolio of **battery management ICs** includes:

### Products

#### Battery monitoring fuel gauge ICs

These devices offer outstanding measurement accuracy (voltage, current, and temperature) and extremely low power consumption in small footprints. They increase battery runtime and lifespan in mobile phones, multimedia players, digital cameras, and other space-constrained portable devices.

### Products

#### Battery chargers

These devices offer charge currents from as little as 200 mA to 1.2 A and are ideal for any rechargeable lithium-ion battery.

### Products

#### Multicell battery monitoring and balancing ICs

The ICs provide high measurement accuracy (voltage, current, and temperature) and cell balancing functions with low power consumption. They increase battery runtime, lifespan, and safety in power tools, home appliances, and garden tools, as well as home and industrial energy storage systems.

## STC3117 provides high accurate battery monitoring

The STC3117 is a gas gauge IC with battery charger control for handheld applications. It includes the ST's Patented OptimGauge™ algorithm for accurate battery capacity calculation.

## **Li-Ion linear charger with load switches and smart reset generator**

The STBC02 and STBC03 battery-charger management chips improve integration without compromising performance and power consumption. They combine a linear battery charger, a 150 mA LDO, two SPDT switches and a Protection Circuit Module for the battery. Moreover, the STBC02 features a digital single wire interface and a smart reset/watchdog function.

In addition to a shipping mode that maximizes battery life during the end product's shelf life, both devices feature a charger enable input to stop the charging process anytime and are automatically powered by the connected battery when the IN pin is not connected to a valid power source (battery mode).

The STBC02/03 offers the perfect solution for wearable and IoT markets, reducing the application cost, footprint and design time.

# DC-DC Switching Converters

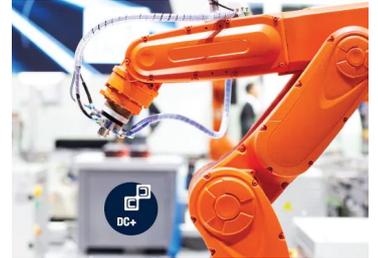

## Overview

ST's monolithic **DC-DC switching regulators** offer input-voltage capability up to 61 V, **buck converters** able to deliver output currents up to 6 A, and high switching frequency up to 2.3MHz.

The broad portfolio of ICs is composed of highly-specialized products to meet every market requirement and **power management** needs: high voltage technology, together with high reliability and robustness for **industrial** and **automotive**, compactness and high **efficiency** for consumer applications.

These **switched-mode power supply** devices embed a full set of protection functions (overcurrent, overvoltage, over-temperature) to increase the MTBF and reduce the number of external components needed for **power conversion**. There are multiple package options, all offering compactness and high thermal performances to fit different applications.

ST also has a unique and fully isolated, resonant, single-stage direct conversion from 48 V straight to the Point-of-Load (PoL), CPU/DDR in full compliance to Intel VR13 and VR12.5 specifications, and a fully scalable solution able to manage up to 6 interleaved cells with dynamic cell shedding and pulse skipping.

## New Programmable Buck Converter for USB Power Delivery

The STPD01 is a programmable synchronous buck converter suitable for **USB power delivery** applications. The device provides those voltages required by USB power delivery systems as per **USB PD 3.0** spec up to 60 W output power (20 V, 3 A) and includes the necessary circuitry for cable drop compensation.

Available in QFN24L 3 x 4 mm2, the STPD01 embeds a **programmable watchdog** to improve the robustness and the safety of the complete system, along with **overvoltage, overcurrent and overtemperature protections**.

Different values of output voltage and current limitation can be also set dynamically through **I2C interface**.

Evaluation board is available to support developers in their designs.

STEVAL-2STPD01

## 38 V 1.5 A / 2 A step-down converters with low quiescent current

The new L6981 and L6982 are easy-to-use **regulators** delivering **high efficiency** capability across all loads. The **wide input voltage range** (3.5 V — 38V), makes them also the ideal solution for 24 V industrial bus-powered systems, HVAC power supplies, battery-powered equipment, decentralized intelligent nodes and always-on devices like smart sensors.

Housed in an **SO8** package, the L6981 (1.5 A) and L6982 (2 A) are also based on a **peak current mode** architecture with internal compensation, to help reduce the overall size and complexity of the end-product designs.

**Evaluation boards** are available, to support developers in their designs.

**STEVAL-L6981CDR ; STEVAL-L6981NDR**

**STEVAL-L6982CDR ; STEVAL-L6982NDR**

## 60 V 300 mA step-down converter with 10uA quiescent current

ST's new L7983 is a compact synchronous buck converter able to satisfy noise-sensitive applications and maximize efficiency at light load thanks to its Low-noise and Low-consumption modes.

With a wide input-voltage range, the L7983 can operate from 12 and 24 V industrial buses with wide safety margins. It is also suitable for battery-powered applications, industrial fail-safe systems, decentralized intelligent nodes, appliances, robotics and precision-sensing applications that leverage the easy-to-use Low-noise mode.

Power supply and converter solution evaluation boards based on the L7983 are also available

## **New synchronous buck controller to handle extreme step-down ratios**

With compact dimensions and an input-voltage range from 6V to 75V, STMicroelectronics' L3751 synchronous buck controller serves different applications, from **industrial equipment to battery powered light electric vehicles**.

Available in QFN20 package with wettable flanks, it is also suited to use in **telecom and networking equipment** that feature commonly used 24V and 48V buses.

The STEVAL-L3751V12, 100W evaluation board, is available to help designers accelerate device selection in power-supply development.

Power Management / DC-DC Switching Converters /48 V Direct Power Conversion

## Display Supplies and Controllers

### Overview

ST's portfolio of **display supplies and controllers** includes:

- **LCD/OLED** PSUs that simplify power-supply circuitry and maximize battery life for feature-rich portable products thanks to their embedded-energy saving features
- **VFD/LED** front panel controllers that integrate VFD/LED drivers, standby power management, a real-time clock (RTC) and key scan matrix in a single package

## eFuses and hot-swap ICs

### Overview

**Hot-swap power management ICs** are designed to control and protect electronic loads, reducing ownership costs of electronic devices and appliances during production and in the field.

They are ideal for all applications that need to perform **hot-plug/hot-swap operations** or require a high level of flexibility and reliability. In such applications, a complete and accurate control of the inrush current during startup/hot plug, along with overcurrent/overvoltage protections are crucial and can make the difference in terms of final **cost of maintenance** and cost of quality.

Compared to traditional protection devices, hot-swap power management ICs enable more versatile and simpler programming of protection parameters, such as overcurrent threshold and start-up time. Thanks to their Enable/fault pins, hot-swap power management ICs can be remotely reset after a fault, which helps to drastically **reduce the number of false-faults** and **equipment downtime**.

Within its hot-swap power management family, ST offers three main kinds of hot-swap controllers:

- **Electronic fuses (eFuses)**: they can replace larger conventional fuses or other protection devices such as resettable PTC fuses. Housed in **small plastic packages**, such as DFN and Flip-chip, they integrate a control logic and a power switch. E-fuses provide overvoltage and overcurrent protection and programmable soft-start time. Typical applications are HDD/SSD arrays and servers as well as industrial and network hot-swap boards.
- **DC Power breakers**: they provide **continuous monitoring** of the input power and interrupt the circuit in case of anomalous power consumption. The power limit is adjustable by the user. Used in home appliances and white goods, they **optimize the design** of power distribution systems, and **simplify the certification** flow to comply with international safety regulations.
- **Other hot-swap ICs**, such as programmable current limiters and controllers for external MOSFETs. They allow maximum configuration **flexibility**, and provide protection to high-power DC rails.

**Power Management/Energy Harvesting and Solar Charging ICs**

Part Number	General Description
SPV1040	High efficiency solar battery charger with embedded MPPT
SPV1050	Ultra low power energy harvester and battery charger with embedded MPPT and LDOs

# Energy Harvesting and Solar Charging ICs

## Overview

**Energy harvesting and solar charging ICs** from ST supply the Internet of Things ecosystem by extracting energy from ambient light or thermal differences to power small devices in applications such as wireless sensors for smart lighting, home and building automation, remote monitoring, presence detection and industrial equipment controls as well as **wearables and fitness sensors**.

These ICs make the small devices energy autonomous and protect the environment by reducing the use – and waste – of primary batteries, while reducing the heavy impact of cabling cost and enhancing flexibility in legacy buildings. Given their ability to “cut the cord” and replace primary batteries, hundreds of millions of these devices could be deployed in environments such as offices, buildings, hotels, industrial sites, airports, malls, remote monitoring infrastructures and wearable fitness / healthcare devices.

## SPV1050 energy harvesting and SPV1040 high-efficiency solar battery charger

ST's **SPV1050** is an extremely high-efficiency power-management and battery-charger solution for wireless sensor nodes that harvests energy from both photovoltaic cells and thermoelectric generators (TEGs) operating up to 400 mW output power. The SPV1050 achieves impressive energy-conversion performance thanks to the embedded maximum power point tracking (MPPT) algorithm, by guarantying up to 99% of maximum power extracted from the harvesting available source. It is compatible with any battery chemistry, including thin-film solid state, super-capacitor, NiMH, NiCd and lithium-ion/lithium polymer. In fact, it applies the typical CC-CV charge profile to optimize the charge and to guarantee its lifetime and overall system safety.

The **SPV1040** is a monolithic solar energy harvester based on a step-up converter configuration optimized to work in outdoor conditions with an output power up to 3 W, and with embedded MPPT algorithm that operates over a 0.45 to 5.5 V input voltage range. The proprietary algorithm maximizes the energy extraction from the source and the transfer to the load is given by the very high conversion efficiency. Fundamental features like over-current, over-voltage and over-temperature guarantee battery and overall system safety and along with the other specs address some typical applications like outdoor environmental sensors, solar lanterns, garden and poles lighting, solar bags and portable mid power consumer.

## High efficiency solar battery charger with embedded MPPT

### Features

- 0.3 V to 5.5 V operating input voltage
- 140 mΩ internal synchronous rectifier
- 120 mΩ internal power active switch
- 100 kHz fixed PWM frequency
- Duty cycle controlled by MPPT algorithm
- Output voltage regulation, overcurrent and overtemperature protection
- Input source reverse polarity protection
- Built-in soft-start
- Up to 95% efficiency
- TSSOP8 package 3x4.4 mm

### Applications

- Smart phones and GPS systems
- Wireless headsets
- Small appliances, sensors
- Portable media players
- Digital still cameras
- Toys and portable healthcare

### Description

The SPV1040 device is a low power, low voltage, monolithic step-up converter with an input voltage range from 0.3 V to 5.5 V, capable of maximizing the energy generated by solar cells (or fuel cells), where low input voltage handling capability is extremely important. Thanks to the embedded MPPT algorithm, even under varying environmental conditions (such as irradiation, dirt, temperature) the SPV1040 offers maximum efficiency in terms of power harvested from the cells and transferred to the output. The device employs a voltage regulation loop, which fixes the charging battery voltage via a resistor divider.

It is possible to set the maximum output current according to charging requirements by a sense resistor .

The SPV1040 protects itself and other application devices by stopping the PWM switching if either the maximum current threshold (up to 1.8 A<sub>pk</sub>) is reached or the maximum temperature limit (up to 155 °C) is exceeded. An additional built-in feature of the SPV1040 is the input source reverse polarity protection, which prevents damage in case of reverse connection of the solar panel on the input.

Figure 1. Block diagram

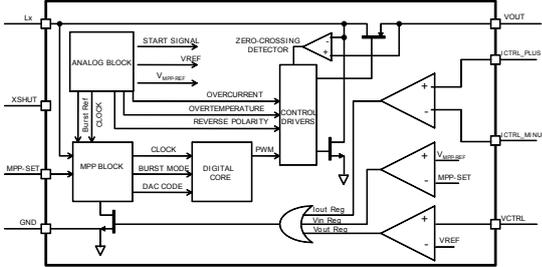

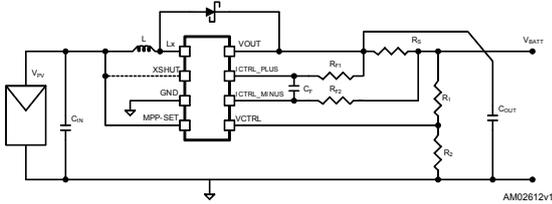

Figure 2. Simplified application circuit

## Ultralow power energy harvester and battery charger

VFQFPN 3 x 3 x 1 mm 20L

### Features

- Transformerless thermoelectric generators and PV modules energy harvester
- High efficiency for any harvesting source
- Up to 70 mA output current
- Fully integrated MOSFETs for Boost or Buck-boost configurations
- Selectable enable/disable MPPT functionality
- Programmable MPPT by external resistors
- 2.6 V to 5.3 V trimmable output overvoltage level ( $\pm 1\%$  accuracy)
- 2.2 V to 3.6 V trimmable output undervoltage level ( $\pm 1\%$  accuracy)
- Two fully independent LDOs (1.8 V and 3.3 V output)
- Enable/disable LDO pins
- Load disconnect function (by-pass transistor open) prior the first start-up (Cold Start) to avoid battery lifetime shortening
- Battery Connected and DC-DC switching open drain indication pins

### Application

- Internet of things
- Remote control
- Fleet and livestock tracking
- Agriculture sensors
- Toll-pay
- Electronic labels
- Smart watch and wearable.

Product label

### Description

The **SPV1050** is an ultra-low power and high-efficiency power manager embedding four MOSFETs for boost or buck-boost DC-DC converter and an additional transistor for the load connection/disconnection.

An internal high accuracy MPPT algorithm can be used to maximize the power extracted from PV panel or TEG.

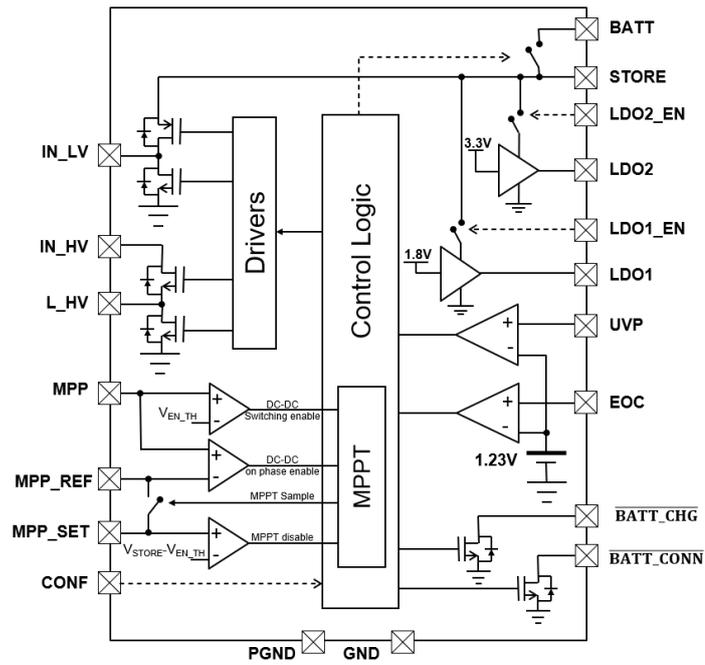

The internal logic works to guarantee tight monitoring of both the end-of-charge voltage ( $V_{EOC}$ ) and the minimum battery voltage ( $V_{UVP}$ ) by opening the pass-transistor at triggering of the  $V_{EOC}$  threshold or at triggering of the  $V_{UVP}$  threshold to preserve the battery life. Both the  $V_{EOC}$  and  $V_{UVP}$  thresholds can be trimmed by external resistors connected between the STORE rail and the EOC and UVP pins, respectively.

In boost configuration (CONF pin connected to the supply source), the IC requires 550 mV and 30  $\mu$ A to Cold start; while after the first start-up the input voltage can range between 150 mV and  $V_{EOC}$ . In buck-boost configuration (CONF pin connected to ground), the IC requires 2.6 V and 5  $\mu$ A at Cold start; while after the first start-up input voltage can range between 150 mV up to 18 V.

The STORE pin is available as unregulated voltage output (e.g. to supply by external LDO a micro-controller), while two fully independent LDOs (1.8 V and 3.3 V) are embedded for powering other companion ICs like MCU, sensors or RF transceivers. Both LDOs can be independently enabled through the related pins.

# Gallium Nitride (GaN) Power ICs

## Overview

### Integrated Smart GaNs

Gallium nitride (GaN) is revolutionizing the power engineering world by enabling high speed, increased efficiency and higher power density never before possible with silicon MOSFETs. Integrating GaN transistors and gate drivers, our advanced MasterGaN systems-in-package offer high efficiency due to their optimized gate drive layout, high power density and increased switching frequency due to minimal parasitic effects.

### STDRIVE® GaN Drivers

The GaN drivers devices are half-bridge gate drivers for enhancement mode GaN FETs or N-channel power MOSFET.

### High Voltage GaN Converters

The high voltage power converters is enriched by the introduction of GaN HEMT (high-electron-mobility transistor) technology. The use of a GaN transistor leads to higher power density, higher efficiency, higher switching frequency with consequent smaller and lighter PCB, simplifying the design of SMPS and improving the overall performances.

## Gate Drivers

### Overview

A necessary companion for discrete power **MOSFETs and IGBTs** as well as digital – microcontrollers, DSPs and FPGs – or analog controllers in any switched-mode power converter **STDRIVE** gate drivers generate the necessary voltage and current level required to **accurately** and **efficiently** activate the power stage in industrial, consumer, computer and automotive applications.

With a range spanning from single- to half-bridge and multiple-channel drivers rated for either low- or high-voltage (up to 1500 V) applications, ST also offers galvanically-isolated gate driver ICs for safety and functional requirements, System-in-Package (SiP) solutions integrating high- and low-side gate drivers and MOSFET-based power stages, responding to the industrial market trend towards higher levels of integration and **lower development costs**.

In many cases, there is an **STDRIVE** perfectly designed to fit your switched-mode power converter design. **STDRIVE** comes with extensive evaluation hardware and software as well as a technical documentation toolbox to help **minimize time-to-market**.

#### Integrated Smart GaNs

Gallium nitride (GaN) is revolutionizing the power engineering world by enabling high speed, increased efficiency and higher power density never before possible with silicon MOSFETs. Integrating GaN transistors and gate drivers, our advanced MasterGaN systems-in-package offer high efficiency due to their optimized gate drive layout, high power density and increased switching frequency due to minimal parasitic effects.

Our MasterGaN platform including **MasterGaN1**, **MasterGaN2**, **MasterGaN3**, **MasterGaN4**, **MasterGaN5** is fully available to better address specific application requirements.

#### STDRIVE® GaN Drivers

The GaN drivers devices are half-bridge gate drivers for enhancement mode GaN FETs or N-channel power MOSFET

### MasterGaN rides the new wave of GaN Power

Revolutionizing power engineering and pushing performance beyond ordinary silicon-based solutions with ST's MasterGaN, industry's first integrated solution with Silicon driver and two GaN power transistors in one package.

# High-density Power Drivers

## Overview

Gate drivers, FETs and protection circuitry integrated into a single package to drive loads in industrial and home-appliance applications, with increased power density per cm<sup>2</sup>.

ST's **high-density power drivers** are System in Package (SiP) solutions integrating in compact QFN packages the STDRIVE gate drivers and MOSFET-based power stages, responding to the industrial market trend towards higher levels of integration and lower development costs.

ST's high-density power drivers enable high power density with a smaller footprint for customers to save valuable board space and reduce the overall bill of material (BOM) cost. They also help reduce development time and eliminate EMI issues at the PCB level because the components are already integrated and tuned at the ST factory, enabling faster time to market.

## System-in-Package Delivers Space Savings with Flexibility and Safety in High-Voltage Brushed DC Motor Applications

PWD5F60 integrates a 600V/3.5A single-phase MOSFET bridge with gate drivers, bootstrap diodes, protection features and two comparators in a 15mm x 7mm outline. The thermally efficient System-in-Package occupies 60% less board real-estate than discrete components, while boosting reliability and simplifying design and assembly

## Complete full-bridge system-in-package includes MOSFETs, gate drivers, and protection features to save space, simplify design, and streamline assembly

The PWD13F60 System-in-Package (SiP) contains a complete 600V/8A single-phase, high-voltage, MOSFET full-bridge power driver in a 13 x 11 mm outline package, saving bill-of-materials costs and board space in industrial motor drives, lamp ballasts, power supplies, converters, and inverters.

- > BOM space and cost saving both during the design and system assembling
  - 600 V full-bridge system-in-package
  - Bootstrap diodes embedded inside gate drivers for reliable switching and low EMI
- > Suitable for a wide range of industrial applications
  - 8 A and 320 mΩ embedded n-channel power MOSFETs
- > Easy interfacing with microcontrollers, DSP units or Hall effect sensors
  - 3.3 and 15 V compatible inputs with hysteresis and pull-down resistors
- > Maximum protection
  - Integrated cross-conduction and under-voltage lock-out protections

# Intelligent Power Switches

## Overview

ST offers a series of intelligent power switches (IPS) for high-side and low-side configurations. These devices integrate the control section (logic interface, drivers, diagnostic and protection features) and the power stage on the same chip, with benefits in terms of compactness, increased system reliability and cost effectiveness.

ST's IPS can be used in combination with any industrial load, resistive, inductive or capacitive.

## Highly-efficient dual-channel high-side switches with extended diagnostics and embedded smart load management

ST's new series of Intelligent Power Switches (IPS) offer a unique smart load management feature enabling to drive any kind of load properly including resistive, inductive, or capacitive loads. The IPS2050H and IPS2050H-32 offer outstanding robustness and the widest supply voltage range up to 65V for the best reliability. The ICs differ by current limitation levels, which are in both cases selectable, ranging from 2.5A up to 23A.

The embedded power stages ensure very efficient operation with the smallest power dissipation thanks to the 25mΩ ON resistance.

The switches are fully compliant to IEC 61000-4-2, IEC 61000-4-4 and IEC 61000-4-5 specifications for ESD, fast-transient burst and surge achieving high EMC immunity.

## LED Drivers

### Overview

ST offers a large portfolio of energy-efficient DC/DC powered **LED driver ICs** for general lighting, display LED backlighting, automotive exterior and interior lighting, RGB and monochromatic **LED drivers** for signage and traffic signals.

Ideal for both parallel and series configurations, our LED driver portfolio enables high-efficiency, high-current accuracy, low-noise and small-size solutions. Topologies include buck regulator, boost regulator, offline LED drivers, linear LED supply, programmable multi-channels with high dimming capability.

#### Our LED driver portfolio includes:

- Boost Current Regulators for LED
- Buck Current Regulators for LED
- Flash LED supply
- LED Array Drivers
- LED Matrix Drivers
- Linear Current Regulators
- Offline LED Drivers
  - HVLED

### Programmable 12-channel RGB-LED Driver with high current accuracy

**With patented features to prevent distracting artefacts in “color-chasing” or “deep breathing” LED animation effects, LED1202 enables smoother and more natural interactions with smart-home devices, wearable electronics, and small appliances.**

The output current can be adjusted separately for each channel by 8-bit analog dimming control up to 20 mA per channel and 12-bit internal PWM dimming control. With 12 output channels, a single LED1202 can drive four RGB LEDs running up to eight programmable patterns and stored sequences. An innovative synchronization feature allows connecting up to eight LED1202 drivers to control larger LED arrays.

The STEVAL-LLL007V1 evaluation kit is available to support evaluation of the LED1202 and aids development of new products and lighting sequences.

### All-in-one high-voltage LED-lighting control chip for efficient dimming, enhanced accuracy and fast start-up

The HVLED001B contains high-voltage startup and sensing circuitry that simplifies connection to the AC line. Its advanced features support multi-platform reuse and compliance with the latest lighting regulations, and include:

- Very accurate line and load regulation over wide range to ensure constant output voltage or output current
- Constant output voltage regulation, with no need of optocoupler, ensures voltage remains below recognized 60V safe limit, improving the application robustness
- Frequency foldback for improved efficiency and regulation at light load with good efficiency at medium load
- Accurate and smooth dimming
- Power-conversion efficiency greater than 90%
- No-load power consumption less than 100mW
- Power factor greater than 0.9, Total Harmonic Distortion (THD) below 10%
- Low EMI at light load and medium load
- Built-in over-current, input over-voltage, brownout, and optocoupler failure protection
- ST's smart Auto-Reload Timer (ART) ensures latch-free protection for enhanced safety

## New LED driver with direct switch control

The ALED8102S is a low-voltage, **8 low-side channel LED driver**. It guarantees up to 20 V output-driving capability and allows users to connect several LEDs in series. In the output stage, the 8 regulated current sources provide 5 to 100 mA constant current to drive the LEDs. Housed in the power-efficient HTSSOP package, the device also features a thermal protection that forces the device in shutdown in case of over-current.

The STEVAL-ILL090V1 evaluation board based on the ALED8102SXTTR LED driver is available, the **board implements two automotive scenarios**:

- an **ambient light** scenario, based on three RGB LEDs with configurable brightness and color;
- a **motorcycle rear light**, with two orange LED strips (representing the arrow lights) placed side by side separated by a red LED circle (simulating the position/stop lights).

## Lighting ICs

### Overview

Based on its 30-year experience in power conversion and high-voltage technology, ST offers a wide portfolio of solutions for electronic ballasts, ranging from high-voltage ballast controllers for analog solutions (with or without embedded PFC), to complete power management units with integrated drivers and voltage regulator for digital platforms.

All these ICs have a 600 V high and low gate driver section to efficiently and cost-effectively drive the power MOSFETs needed to drive the lamp.

# Linear Voltage Regulators

## Overview

ST offers one of the widest selection of fixed and adjustable **linear voltage regulators**. Beside a complete portfolio of Industry **Standard regulators** for both Positive and Negative output, we offer an ever-expanding range of High performance **LDO regulators** addressing all the major trends in the industry.

Among our products, you can find the optimal combination of low dropout voltage and quiescent current - for the highest efficiency design - or dynamic performances for the best transient response, ripple rejection and low noise. All this coupled with a choice of the smallest form factor packages for size conscious applications.

## New 200 mA and 1.2A LDOs support up to 18 V input voltage

The LDK320 and LDL212 complete ST's family of cost-effective LDOs, offering an optimal combination of low dropout voltage, low quiescent current and remarkable dynamic performance at a favorable price.

Thanks to the wide input voltage operating range, as high as 18 V, they can be used as post-regulators in consumer applications (TVs, STBs), home appliances and industrial control modules, or directly attached to medium voltage battery packs in laptops and other battery-operated equipment. The LDK320 is also available in a 0.5% high accuracy version.

Both products are available in tiny packages allowing designers to save PCB space and build smaller systems.

## STLQ015 ultra-low quiescent current linear regulators

The STLQ015 ultra-low consumption LDOs provide up to 150 mA current from an input voltage ranging from 1.5 to 5.5 V. They feature a quiescent current of just 1.4  $\mu\text{A}$  at the maximum load and a standby current of typically 1 nA, extending the battery lifetime in those applications requiring very long standby time. Requiring only two small external capacitors, they provide a cost-effective and space-saving solution for powering microcontrollers in portable and battery-powered systems, electronic sensors, home medical instruments and portable entertainment gadgets. The STLQ015 LDOs are available in a wide range of output voltages, from 0.8 V to 3.3 V in 100 mV steps.

Power Management / Linear Voltage Regulators/Low Dropout (LDO) Linear Regulators

## LNB supplies

### Overview

ST's **LNB** (low-noise block) **supply ICs** are intended for analog and digital satellite receivers/sat-TV, sat-PC cards, and are compliant with the latest international satellite standards (DTV, Eutelsat), offering flexibility of bidirectional DiSEqC™ 2.0 communications. **LNB supply IC** are highly-efficient monolithic linear and switching ICs specifically designed to provide both power and interface signals to the LNB downconverter placed on the antenna dish, via the coaxial cable.

## Photovoltaic ICs

### Overview

ST's portfolio of photovoltaic ICs includes both cool bypass switches designed to improve the reliability of panel electronics, and DC-DC converters with built-in MPPT which maximize power conversion of solar panels independently of temperature and the amount of solar irradiation.

## Power Over Ethernet ICs

### Overview

Power over Ethernet (PoE) is a widely adopted technology used to transfer both data and electrical power over an RJ-45 cable.

ST offers solutions for PoE applications, on the powered devices (PD) side, compliant with both the more recent IEEE 802.3at specification, commonly known as PoE+, and the former IEEE 802.3af (PoE).

The design of power supply sections for all powered devices can be greatly simplified with the PM880x family, integrating a PoE interface and a current-mode PWM controller. The PoE interface incorporates all the functions required by the communication standard, including detection, classification, undervoltage lockout (UVLO) and in-rush current limitation.

**Power Management/Power Over Ethernet Ics**

Part Number	General Description	Package	Communication standards supported	Signature resistor	Internal DC-DC converter	R <sub>DS(on)</sub> (Ω) typ	Inrush Current (mA) max	Input Current (mA) max	Topology

## Voltage References

### Overview

ST offers a wide range of fixed and adjustable voltage references ranging from general-purpose high-power shunts, suitable for industrial, automotive and SMPS applications, to high-precision and low-consumption shunt and series devices, suitable for battery-powered applications.

ST's portfolio of precision voltage references include:

- High-power adjustable shunt references, with a maximum cathode current of 100 mA and an adjustable output voltage from 0.6 to 36 V.
- Micropower shunt and series references, dedicated to portable applications, with a minimum cathode current (shunt) as low as 40  $\mu$ A, minimum quiescent current of 5  $\mu$ A (series) and an initial accuracy as good as 0.1%.

# Wireless Charger ICs

## Overview

As the world's leading supplier for wireless power solutions, ST wireless battery charger ICs cover all major standards and technologies across a complete portfolio of transmitter and receiver chipsets.

Our advanced wireless battery charging solutions currently feature in many mid- to high-power applications, including a wide variety of market solutions like fast charging smartphones, wearables, hearables, medical applications, and industrial tools.

Our solutions are optimized for different applications and are compliant with Wireless Power Consortium (WPC) Qi standards and other major wireless charging standards.

ST wireless power solutions enable high-power charging at improved speeds and contribute to better overall user experience, while critical safety features ensure the end-consumer remains protected.

Breakthrough innovations such as adaptive rectifier configuration (ARC) mode help our customers build great products with wireless power, while our proprietary ST Super Charge (STSC) protocol enables fast charging up to the maximum 100 W power-transfer rate.

## Your competitive advantages with ST wireless charger ICs

- Market proven wireless power ICs implemented by the largest smartphone makers in the world
- Innovative solutions with industry-first features
- Fast time-to-market optimized by our unique wireless power software and development ecosystem.
- Highest wireless power IC performance from the inventor of BCD technology, which is used by chipmakers around the world
- Strong partnerships with the Wireless Power Consortium (WPC) and the largest wireless power coil makers

## Applications

### Wearables

Fitness trackers  
Smart and sports  
watches

### Smartphones, tablets and eReaders

### Asset Tracking

Indoor localization and  
warehouse logistics  
Goods guarantee  
Disposables

## Product types:

### Wireless charger receivers

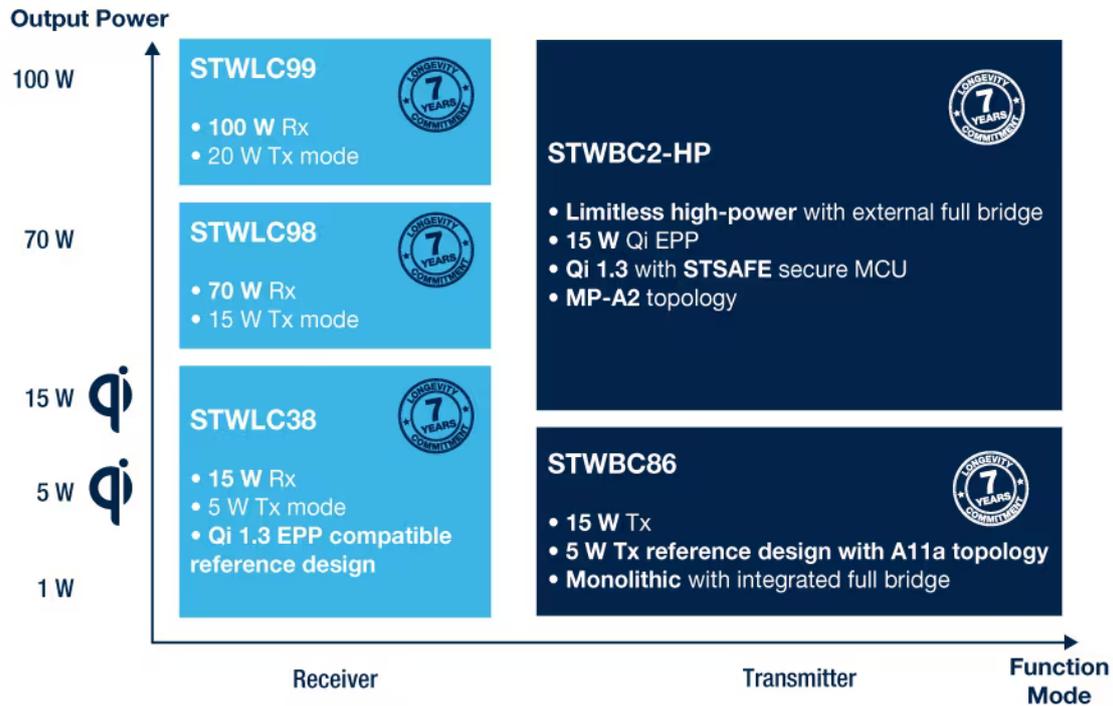

Qi-compliant wireless charging ICs with higher efficiency and enhanced safety for a wide range of applications.

## Wireless charger transmitters

Qi-compliant transmitters ensure fast and stable single and multicoil wireless charging for applications from 2.5 W to 100 W.

### Discover our portfolio

### Benefits:

#### Qi wireless charging

- Qi standard compliance ensures a consistent, safe, and simple user experience with other Qi-certified products

#### Foreign object detection (FOD)

- FOD provides detection accuracy and ensures the security of the charging operation to avoid overheating

#### Spatial freedom

- Proprietary adaptive rectifier configuration (ARC) mode enhances detection distance by up to 50% in all directions

#### Fast charging

- Extended power profile (EPP) speeds up charging time by up to three times

#### High efficiency

- Excellent efficiency performance with built-in power management capability

#### Protection features

- Protection features such as on-chip thermal management, overvoltage, and overcurrent protection to prevent overheating

#### Reverse charging mode

- Receivers can operate as a wireless transmitter without any change in hardware design

#### Better designs

- Eliminating the charging socket can save space and allow sealing against water or dust and improve product life

#### Reduced BOM

- Simplifying implementation of wireless power transmitter systems through reduction of discrete components

#### Communication interfaces

- Inbuilt I<sup>2</sup>C, UART, SPI, and GPIO interfaces allow easy configuration of parameters

#### Characteristics
